Project Description :

This project focuses on using Artificial Intelligence to help families reduce everyday food wastage at home. The system keeps track of groceries, monitors expiry dates, and reminds users before items get spoiled. It allows scanning bills or products to automatically update the kitchen inventory. Using image recognition and pattern analysis, the AI suggests recipes based on items that are about to expire and offers smart meal-planning ideas. It provides storage tips, prevents over-buying, and generates weekly reports on how much food has been saved. Designed for all age groups, the AI acts like a smart kitchen assistant that encourages sustainable living and helps households use their food more efficiently.
